

Curl ring measurement for monobloc aerosol cans

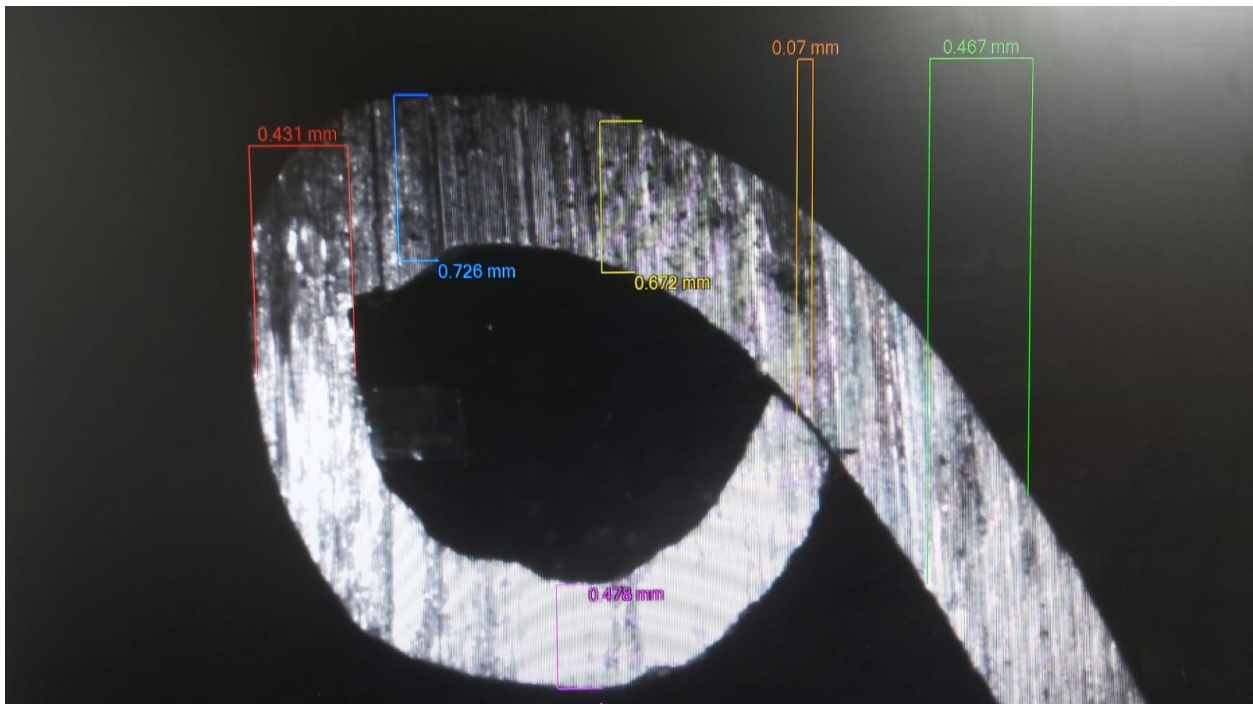

Quality by Vision

Optical HD unit:

- Compatible with Win 7, or 10
- High Definition optical unit with USB camera
- Specially designed optical unit for curl ring measurement on mono-bloc aerosol cans
- All measurements done instantly from the image
- Customizable HTML and Excel reporting system
- Remote access to measurement data and statistics over the network
- Includes calibration gauge (certified by Quality By Vision)
- Manuals in English

Curl image:

SPC

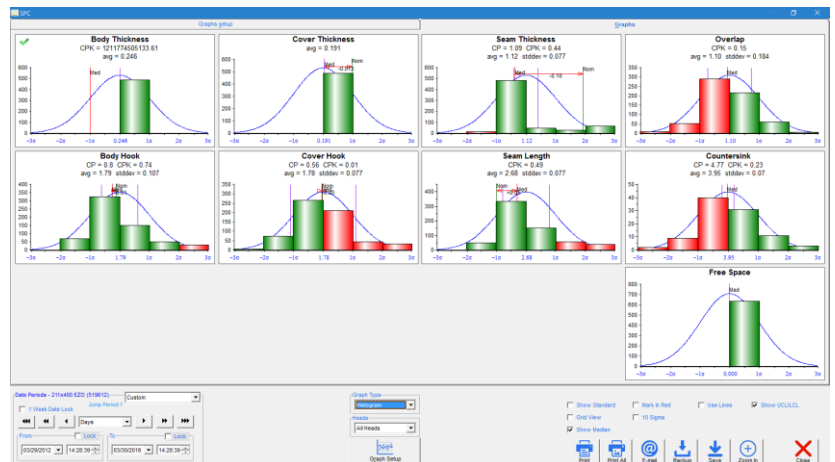

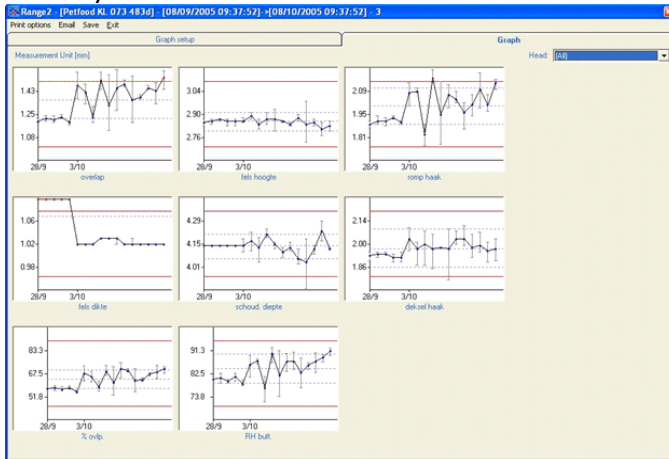

The newly designed SPC software is now integrated into the system and allows operators and administrators to view statistics locally as well as remotely over the corporate network (LAN).

The new Statistical Process Control (SPC) six-sigma software allows you to see an overview of what's going on, then drill down to a particular data point, see its values, which report it belongs to, who measured it, see all the reports attached to that data point and even see the measurement image that caused that data point to appear.

This amazing drill down capabilities gives the Q/A manager unprecedented control to review potential issues, verify that everything is working correctly with very little need for knowing statistics – all you need is common sense.

The new system has been fine-tuned towards easily understanding what each graph represents and provides drilldown access to any relevant data points. Predicting future problems using statistical trending has never been easier.

For example, if you see a red point, representing a point outside of the specifications, you can immediately view the report where that point belongs. You can easily view and detect trends, as well as analyze statistical data .
